

Project Report Guidelines

A Comprehensive Template for Web Development Final Submissions
(HTML, CSS, JavaScript)

Phase 1: Project Initiation

Defining the core purpose and boundaries of your web application.

1. INTRODUCTION & OBJECTIVES

Background:

Provide context on the industry or domain of your website.

Primary Objectives:

List 3-4 clear goals your website aims to achieve.

Problem Statement:

Identify the specific user gap or need you are addressing.

Scope:

Define the features included (and excluded) from this version.

Phase 2: Requirements

Translating user needs into technical specifications and quality standards.

2. REQUIREMENTS SPECIFICATION

Functional Requirements

What the system **must** do. Focus on user actions.

- User Registration/Login
- Content Management
- Form Submission
- Data Sorting/Filtering

Non-Functional Requirements

System attributes (The "ilities"). How the system behaves.

- Performance (Load speed < 2s)
- Usability (Intuitive navigation)
- Security (Encrypted passwords)
- Responsiveness (Mobile-friendly)

Phase 3: System Modeling

Visualizing the system architecture and logic using standard UML diagrams.

3.2 DATA FLOW DIAGRAMS

Your project report must include Data Flow Diagrams (DFD) to visualize data movement.

Level 0 DFD (Context Diagram)

- Illustrates the entire system as a single process, showing interactions with external entities.

Level 1 DFD

- Decomposes the Level 0 process into smaller, sub-processes to show data flow within the system.

3. STRUCTURAL & BEHAVIORAL DIAGRAMS

Use Case Diagram

- Illustrates the relationship between Actors and System Functions, defining user interactions and system boundaries.

Activity Diagram

- Shows the dynamic workflow of a specific business process, detailing the sequence of actions and decision points.

3.3 DATABASE DESIGN

If your project includes a database, an **Entity-Relationship (ER) Diagram** is mandatory.

It must define:

🔑 Primary & Foreign Keys

🔗 Table Relationships

☰ Attribute Data Types

Phase 4: UI/UX & Execution

Showcasing the visual identity, implementation tools, and technical stack.

4. IMPLEMENTATION & TECHNOLOGIES

Frontend Stack

Documentation of HTML5 structure, CSS3 styling, and JS interactivity.

Responsive Design

Mobile-first approach using Flexbox, CSS Grid, and Media Queries.

Design Identity

Detailed Color Palette (Hex codes) and Typography definitions.

5. TESTING & EVALUATION

Test Case ID	Feature Description	Test Methodology	Expected Result
TC-01	Form Validation	Unit Testing (Manual)	Error message on empty fields
TC-02	Navigation Menu	Functional Testing	Links point to correct pages
TC-03	Responsiveness	Compatibility Testing	Layout scales to mobile (375px)

** Note: Students must include a summary of user feedback and areas for future improvement.*
